THIS IS
HOW
YOU MEASURE AND MANAGE A
RESILIENT
NETWORK.

REDSEAL

Actively manage your digital resilience capabilities.

Even with the billions invested in hundreds of network security products, incidents, breaches, and failures are inevitable.

The most forward-thinking business leaders realize that the best approach is to make their networks resilient. Resilience is the ability to stay in business and minimize damage to your customers, your reputation, and your bottom line when the inevitable incident happens. Even though you can never prevent every attack, a resilient network can prevent an incident from becoming a breach, stopping an attacker in his tracks.

So how do you measure and manage your digital resilience? That's where RedSeal comes in.

RedSeal. The measure of resilience.

Put decision-making power in your hands.

With RedSeal, you're able to optimize your existing security investments by understanding the state of the network, measuring resilience, verifying compliance, and accelerating incident response.

With an accurate, up-to-date model of your as-built network, RedSeal determines your Digital Resilience Score™, modeled after a creditworthiness score, so you can accurately measure how prepared you are now and actively manage progress toward where you want to be.

RedSeal is the essential cybersecurity analytics platform that puts security management and decision-making power right in your hands.

RedSeal gives you the power to:

Understand every element, segment, and enclave of your network.

RedSeal analyzes your network and automatically builds a model, so you can understand and continuously monitor your whole network in order to:

- Model, map, and visualize your actual network as it really is, including cloud and virtual networks.
- Visualize end-to-end access, intended and unintended, between any two points of your network or the Internet.
- Visualize detailed access paths for individual devices in a specific path and pinpoint rules affecting access on each device.
- Visualize hidden areas of your network, so you can maintain a complete inventory of all network assets.

Measure resilience.

With your RedSeal Digital Resilience Score, you can measure, benchmark, and set targets to actively manage your investments in the digital resilience of your network and security infrastructure.

With a single metric for the resilience of your network, accessible through RedSeal's control panel or the RedSeal app, your management team has an easy way to understand, measure, and make decisions about your security posture.

Verify compliance.

As the complexity of networks increases, so does the need to accurately create and track access policies. RedSeal makes verifying compliance with both mandates and your organization's own policies efficient and clear.

You can continuously verify that your network complies, even as you make changes. Spot issues, like unintended, unwanted, or excessive access, and get the detail you need to remediate. RedSeal has key controls for PCI, NERC CIP, NIST 800-53, DISA's STIGs, and HIPAA.

Accelerate response to incidents and vulnerabilities.

As the pressure increases to identify, analyze, and contain network incidents more and more quickly, you need a full understanding of what's in your network and how it all connects. You need network context.

RedSeal provides network context with actionable intelligence for rapid response by identifying exposed assets and prioritizing actions. Waste no time with guesswork.
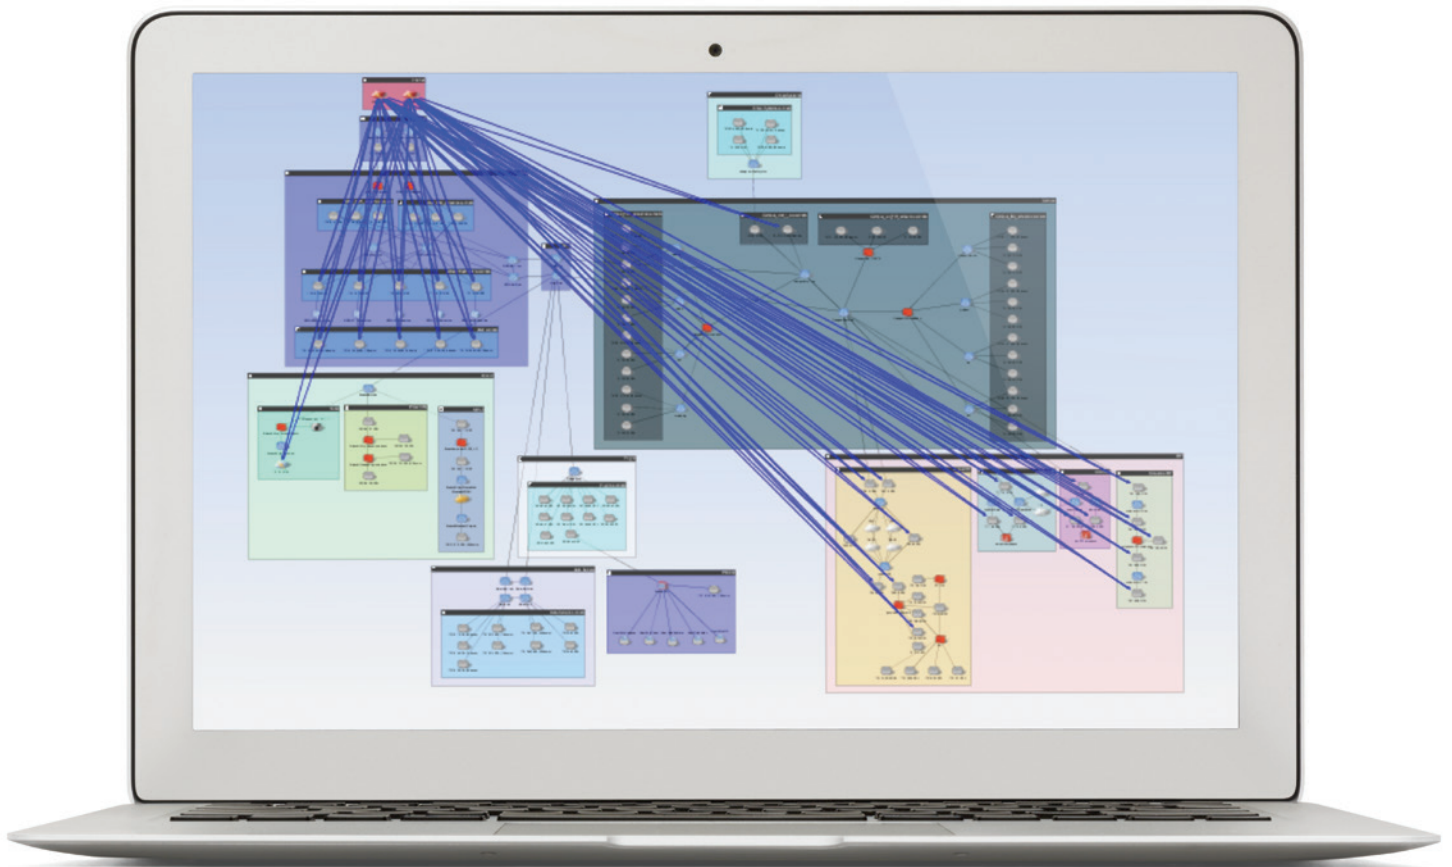

The RedSeal security analytics platform is available on a virtual or physical appliance.

Pricing is based on the number of Layer 3 and Layer 2 devices in your network.

Put your network's digital resilience in your hands. With RedSeal.

RedSeal's customers are FORBES Global 2000 corporations and government agencies that depend on the most sophisticated security. Founded in 2004, RedSeal is headquartered in Sunnyvale, California, and serves customers globally through a direct sales and channel partner network.
